WO 02/34900 A1

(54) Title: DIPEPTIDYL PEPTIDASES

(57) Abstract: Peptides which comprise sequences as shown in Seq ID NO:2 or HisGlyTrpSerTypGlyGlyPheLeu; LeuAspGluAsnValHisPhePhe; GluArgHisSerIleArg and PheValIleGlnGluGluPhe which show peptidase ability and have substrate specificity for at least one of the compounds H-Ala-Pro-pNA, H-Gly-Pro-pNA, H-Gly-Pro-pNA and H-Arg-Pro-pNA. peptides having sequence ID No:7 are also claimed. Nucleic acids, vectors, antibodies and hybridoma cells are also claimed with reference to the above sequences and there abilities.

BEST AVAILABLE COPY

**TITLE**  
**DIPEPTIDYL PEPTIDASES**

**FIELD OF INVENTION**

5 The invention relates to a dipeptidyl peptidase, to a nucleic acid molecule which encodes it, and to uses of the peptidase.

**BACKGROUND OF THE INVENTION**

10 The dipeptidyl peptidase (DPP) IV-like gene family is a family of molecules which have related protein structure and function [1-3]. The gene family includes the following molecules: DPPIV (CD26), dipeptidyl amino-peptidase-like protein 6 (DPP6), dipeptidyl amino-peptidase-like protein 8  
15 (DPP8) and fibroblast activation protein (FAP) [1,2,4,5]. Another possible member is DPPIV- $\beta$ [6].

The molecules of the DPPIV-like gene family are serine proteases, they are members of the peptidase family S9b,  
20 and together with prolyl endopeptidase (S9a) and acylaminoacyl peptidase (S9c), they are comprised in the prolyl oligopeptidase family[5,7].

DPPIV and FAP both have similar postproline dipeptidyl  
25 amino peptidase activity, however, unlike DPPIV, FAP also has gelatinase activity[8,9].

DPPIV substrates include chemokines such as RANTES, eotaxin, macrophage-derived chemokine and stromal-cell-  
30 derived factor 1; growth factors such as glucagon and glucagon-like peptides 1 and 2; neuropeptides including neuropeptide Y and substance P; and vasoactive peptides[10-12].

35 DPPIV and FAP also have non-catalytic activity; DPPIV binds adenosine deaminase, and FAP binds to  $\alpha_3\beta_1$  and  $\alpha_5\beta_1$  integrin[13-14].

In view of the above activities, the DPPIV-like family members are likely to have roles in intestinal and renal handling of proline containing peptides, cell adhesion, peptide metabolism, including metabolism of cytokines, neuropeptides, growth factors and chemokines, and immunological processes, specifically T cell stimulation[3,11,12].

Consequently, the DPPIV-like family members are likely to be involved in the pathology of disease, including for example, tumour growth and biology, type II diabetes, cirrhosis, autoimmunity, graft rejection and HIV infection[3,15-18].

Inhibitors of DPPIV have been shown to suppress arthritis, and to prolong cardiac allograft survival in animal models *in vivo*[19,20]. Some DPPIV inhibitors are reported to inhibit HIV infection[21]. It is anticipated that DPPIV inhibitors will be useful in other therapeutic applications including treating diarrhoea, growth hormone deficiency, lowering glucose levels in non insulin dependent diabetes mellitus and other disorders involving glucose intolerance, enhancing mucosal regeneration and as immunosuppressants[3,21-24].

There is a need to identify members of the DPPIV-like gene family as this will allow the identification of inhibitor(s) with specificity for particular family member(s), which can then be administered for the purpose of treatment of disease. Alternatively, the identified member may of itself be useful for the treatment of disease.

#### SUMMARY OF THE INVENTION

The present invention seeks to address the above identified need and in a first aspect provides a peptide which comprises the amino acid sequence shown in SEQ ID NO:2.

- As described herein, the inventors believe that the peptide is a prolyl oligopeptidase and a dipeptidyl peptidase, because it has substantial and significant homology with the amino acid sequences of DPPIV and DPP8. As homology is  
5 observed between DPP8, DPPIV and DPP9, it will be understood that DPP9 has a substrate specificity for at least one of the following compounds: H-Ala-Pro-pNA, H-Gly-Pro-pNA and H-Arg-Pro-pNA.
- 10 The peptide is homologous with human DPPIV and DPP8, and importantly, identity between the sequences of DPPIV and DPP8 and SEQ ID NO: 2 is observed at the regions of DPPIV and DPP8 containing the catalytic triad residues and the  
15 two glutamate residues of the  $\beta$ -propeller domain essential for DPPIV enzyme activity. The observation of amino acid sequence homology means that the peptide which has the amino acid sequence shown in SEQ ID NO:2 is a member of the DPPIV-like gene family. Accordingly the peptide is now named and described herein as DPP9.
- 20 The following sequences of the human DPPIV amino acid sequence are important for the catalytic activity of DPPIV: (i) Trp<sup>617</sup>GlyTrpSerTyrGlyGlyTyrVal; (ii) Ala<sup>707</sup>AspAspAsnValHisPhe; (iii) Glu<sup>738</sup>AspHisGlyIleAlaSer; and  
25 (iv) Trp<sup>201</sup>ValTyrGluGluGluVal [25-28]. As described herein, the alignment of the following sequences of DPP9: His<sup>833</sup>GlyTrpSerTyrGlyGlyPheLeu; Leu<sup>913</sup>AspGluAsnValHisPhePhe; Glu<sup>944</sup>ArgHisSerIleArg and Phe<sup>350</sup>ValIleGlnGluGluPhe with  
30 sequences (i) to (iv) above, respectively, suggests that these sequences of DPP9 are likely to confer the catalytic activity of DPP9. This is also supported by the alignment of DPP9 and DPP8 amino acid sequences. More specifically, DPP8 has substrate specificity for H-Ala-Pro-pNA, H-Gly-Pro-pNA and H-Arg-Pro-pNA, and shares near identity, with  
35 only one position of amino acid difference, in each of the above described sequences of DPP9. Thus, in a second aspect, the invention provides a peptide comprising the following amino acid sequences:

HisGlyTrpSerTyrGlyGlyPheLeu; LeuAspGluAsnValHisPhePhe;  
GluArgHisSerIleArg and PheValIleGlnGluGluPhe; which has the  
substrate specificity of the sequence shown in SEQ ID NO:2.

- 5 Also described herein, using the GAP sequence alignment  
algorithm, it is observed that DPP9 has 53% amino acid  
similarity and 29% amino acid identity with a *C. elegans*  
protein. Further, as shown herein, a nucleic acid molecule  
which encodes DPP9, is capable of hybridising specifically  
10 with DPP9 sequences derived from non-human species,  
including rat and mouse. Further, the inventors have  
isolated and characterised a mouse homologue of human DPP9.  
Together these data demonstrate that DPP9 is expressed in  
non-human species. Thus in a third aspect, the invention  
15 provides a peptide which has at least 91% amino acid  
identity with the amino acid sequence shown in SEQ ID NO:2,  
and which has the substrate specificity of the sequence  
shown in SEQ ID NO:2. Typically the peptide has the  
sequence shown in SEQ ID NO:4. Preferably, the amino acid  
20 identity is 75%. More preferably, the amino acid identity  
is 95%. Amino acid identity is calculated using GAP  
software [GCG Version 8, Genetics Computer Group, Madison,  
WI, USA] as described further herein. Typically, the  
peptide comprises the following sequences:  
25 HisGlyTrpSerTyrGlyGlyPheLeu; LeuAspGluAsnValHisPhePhe;  
GluArgHisSerIleArg and PheValIleGlnGluGluPhe.

- In view of the homology between DPPIV, DPP8 and DPP9 amino  
acid sequences, it is expected that these sequences will  
30 have similar tertiary structure. This means that the  
tertiary structure of DPP9 is likely to include the seven-  
blade  $\beta$ -propeller domain and the  $\alpha/\beta$  hydrolase domain of  
DPPIV. These structures in DPP9 are likely to be conferred  
by the regions comprising  $\beta$ -propeller, Val<sup>226</sup> to Ala<sup>705</sup>,  $\alpha/\beta$   
35 hydrolase, Ser<sup>706</sup> to Leu<sup>969</sup> and about 70 to 90 residues in  
the region Ser<sup>136</sup> to Gly<sup>225</sup>. As it is known that the  $\beta$ -  
propeller domain regulates proteolysis mediated by the  
catalytic triad in the  $\alpha/\beta$  hydrolase domain of prolyl

oligopeptidase, [29] it is expected that truncated forms of DPP9 can be produced, which have the substrate specificity of the sequence shown in SEQ ID NO:2, comprising the regions referred to above (His<sup>833</sup>GlyTrpSerTyrGlyGlyPheLeu; 5 Leu<sup>913</sup>AspGluAsnValHisPhePhe; Glu<sup>944</sup>ArgHisSerIleArg and Phe<sup>350</sup>ValIleGlnGluGluPhe) which confer the catalytic specificity of DPP9. Examples of truncated forms of DPP9 which might be prepared are those in which the region conferring the  $\beta$ -propeller domain and the  $\alpha/\beta$  hydrolase 10 domain are spliced together. Other examples of truncated forms include those that are encoded by splice variants of DPP9 mRNA. Thus although, as described herein, the biochemical characterisation of DPP9 shows that DPP9 consists of 969 amino acids and has a molecular weight of 15 about 110 kDa, it is recognised that truncated forms of DPP9 which have the substrate specificity of the sequence shown in SEQ ID NO:2, may be prepared using standard techniques [30,31]. Thus in a fourth aspect, the invention provides a fragment of the sequence shown in SEQ ID NO: 2, 20 which has the substrate specificity of the sequence shown in SEQ ID NO:2. The inventors believe that a fragment from Ser136 to Leu969 (numbered according to SEQ ID NO:2) would have enzyme activity.

25 It is recognised that DPP9 may be fused, or in other words, linked to a further amino acid sequence, to form a fusion protein which has the substrate specificity of the sequence shown in SEQ ID NO:2. An example of a fusion protein is one which comprises the sequence shown in SEQ ID NO:2 which 30 is linked to a further amino acid sequence: a "tag" sequence which consists of an amino acid sequence encoding the V5 epitope and a His tag. An example of another further amino acid sequence which may be linked with DPP9 is a glutathione S transferase (GST) domain [30]. Another 35 example of a further amino acid sequence is a portion of CD8 $\alpha$  [8]. Thus in one aspect, the invention provides a fusion protein comprising the amino acid sequence shown in

SEQ ID NO:2 linked with a further amino acid sequence, the fusion protein having the substrate specificity of the sequence shown in SEQ ID NO:2.

- 5 It is also recognised that the peptide of the first aspect of the invention may be comprised in a polypeptide, so that the polypeptide has the substrate specificity of DPP9. The polypeptide may be useful, for example, for altering the protease susceptibility of DPP9, when used in *in vivo*
- 10 applications. An example of a polypeptide which may be useful in this regard, is albumin. Thus in another embodiment, the peptide of the first aspect is comprised in a polypeptide which has the substrate specificity of DPP9.
- 15 In one aspect, the invention provides a peptide which includes the amino acid sequence shown in SEQ ID NO:7. In one embodiment the peptide consists of the amino acid sequence shown in SEQ ID NO:7.
- 20 As described further herein, the amino acid sequence shown in SEQ ID NO:7, and the amino acid sequences of DPPIV, DPP8 and FAP are homologous. DPPIV, DPP8 and FAP have dipeptidyl peptidase enzymatic activity and have substrate specificity for peptides which contain the di-peptide
- 25 sequence, Ala-Pro. The inventors note that the amino acid sequence shown in SEQ ID NO:7 contains the catalytic triad, Ser-Asp-His. Accordingly, it is anticipated that the amino acid sequence shown in SEQ ID NO:7 has enzymatic activity in being capable of cleaving a peptide which contains Ala-
- 30 Pro by hydrolysis of a peptide bond located C-terminal adjacent to proline in the di-peptide sequence.

In one embodiment, the peptide comprises an amino acid sequence shown in SEQ ID NO:7 which is capable of cleaving

35 a peptide bond which is C-terminal adjacent to proline in the sequence Ala-Pro. The capacity of a dipeptidyl

peptidase to cleave a peptide bond which is C-terminal adjacent to proline in the di-peptide sequence Ala-Pro can be determined by standard techniques, for example, by observing hydrolysis of a peptide bond which is C-terminal adjacent to proline in the molecule Ala-Pro-p-nitroanilide.

The inventors recognise that by using standard techniques it is possible to generate a peptide which is a truncated form of the sequence shown in SEQ ID NO:7, which retains the proposed enzymatic activity described above. An example of a truncated form of the amino acid sequence shown in SEQ ID NO:7 which retains the proposed enzymatic activity is a form which includes the catalytic triad, Ser-Asp-His. Thus a truncated form may consist of less than the 831 amino acids shown in SEQ ID NO:7. Accordingly, in a further embodiment, the peptide is a truncated form of the peptide shown in SEQ ID NO:7, which is capable of cleaving a peptide bond which is C-terminal adjacent to proline in the sequence Ala-Pro.

It will be understood that the amino acid sequence shown in SEQ ID NO:7 may be altered by one or more amino acid deletions, substitutions or insertions of that amino acid sequence and yet retain the proposed enzymatic activity described above. It is expected that a peptide which is at least 47% similar to the amino acid sequence of SEQ ID NO:7, or which is at least 27% identical to the amino acid sequence of SEQ ID NO:7, will retain the proposed enzymatic activity described above. The % similarity can be determined by use of the program/algorithm "GAP" which is available from Genetics Computer Group (GCG), Wisconsin. Thus in another embodiment of the first aspect, the peptide has an amino acid sequence which is at least 47% similar to the amino acid sequence shown in SEQ ID NO:7, and is capable of cleaving a peptide bond which is C-terminal adjacent to proline in the sequence Ala-Pro.

As described above, the isolation and characterisation of DPP9 is necessary for identifying inhibitors of DPP9 catalytic activity, which may be useful for the treatment of disease. Accordingly, in a fifth aspect, the invention provides a method of identifying a molecule capable of inhibiting cleavage of a substrate by DPP9, the method comprising the following steps:

- (a) contacting DPP9 with the molecule;
- 10 (b) contacting DPP9 of step (a) with a substrate capable of being cleaved by DPP9, in conditions sufficient for cleavage of the substrate by DPP9; and
- (c) detecting substrate not cleaved by DPP9, to identify that the molecule is capable of inhibiting
- 15 cleavage of the substrate by DPP9.

It is recognised that although inhibitors of DPP9 may also inhibit DPPIV and other serine proteases, as described herein, the alignment of the DPP9 amino acid sequence with most closely related molecules, (i.e. DPPIV), reveals that the DPP9 amino acid is distinctive, particularly at the regions controlling substrate specificity. Accordingly, it is expected that it will be possible to identify inhibitors which inhibit DPP9 catalytic activity specifically, which do not inhibit catalytic activity of DPPIV-like gene family members, or other serine proteases. Thus, in a sixth aspect, the invention provides a method of identifying a molecule capable of inhibiting specifically, the cleavage of a substrate by DPP9, the method comprising the following

20 steps:

- (a) contacting DPP9 and a further protease with the molecule;
- (b) contacting DPP9 and the further protease of step (a) with a substrate capable of being cleaved by DPP9 and
- 35 the further protease, in conditions sufficient for cleavage of the substrate by DPP9 and the further protease; and

(c) detecting substrate not cleaved by DPP9, but cleaved by the further protease, to identify that the molecule is capable of inhibiting specifically, the cleavage of the substrate by DPP9.

5

In a seventh aspect, the invention provides a method of reducing or inhibiting the catalytic activity of DPP9, the method comprising the step of contacting DPP9 with an inhibitor of DPP9 catalytic activity. In view of the  
10 homology between DPP9 and DPP8 amino acid sequences, it will be understood that inhibitors of DPP8 activity may be useful for inhibiting DPP9 catalytic activity. Examples of inhibitors suitable for use in the seventh aspect are described in [21,32,33]. Other inhibitors useful for  
15 inhibiting DPP9 catalytic activity can be identified by the methods of the fifth or sixth aspects of the invention.

In one embodiment, the catalytic activity of DPP9 is reduced or inhibited in a mammal by administering the  
20 inhibitor of DPP9 catalytic activity to the mammal. It is recognised that these inhibitors have been used to reduce or inhibit DPPIV catalytic activity *in vivo*, and therefore, may also be used for inhibiting DPP9 catalytic activity *in vivo*. Examples of inhibitors useful for this purpose are  
25 disclosed in the following [21,32-34].

Preferably, the catalytic activity of DPP9 in a mammal is reduced or inhibited in the mammal, for the purpose of treating a disease in the mammal. Diseases which are  
30 likely to be treated by an inhibitor of DPP9 catalytic activity are those in which DPPIV-like gene family members are associated [3,10,11,17,21,36], including for example, neoplasia, type II diabetes, cirrhosis, autoimmunity, graft rejection and HIV infection.

35

Preferably, the inhibitor for use in the seventh aspect of the invention is one which inhibits the cleavage of a peptide bond C-terminal adjacent to proline. As described

herein, examples of these inhibitors are 4-(2-aminoethyl)benzenesulfonylfluoride, aprotinin, benzamidine/HCl, Ala-Pro-Gly, H-Lys-Pro-OH HCl salt and zinc ions, for example, zinc sulfate or zinc chloride. More preferably, the inhibitor is one which specifically inhibits DPP9 catalytic activity, and which does not inhibit the catalytic activity of other serine proteases, including, for example DPPIV, DPP8 or FAP.

10 In an eighth aspect, the invention provides a method of cleaving a substrate which comprises contacting the substrate with DPP9 in conditions sufficient for cleavage of the substrate by DPP9, to cleave the substrate. Examples of molecules which can be cleaved by the method are H-Ala-Pro-pNA, H-Gly-Pro-pNA and H-Arg-Pro-pNA. Molecules which are cleaved by DPPIV including RANTES, eotaxin, macrophage-derived chemokine, stromal-cell-derived factor 1, glucagon and glucagon-like peptides 1 and 2, neuropeptide Y, substance P and vasoactive peptide are also likely to be cleaved by DPP9 [11,12]. In one embodiment, the substrate is cleaved by cleaving a peptide bond C-terminal adjacent to proline in the substrate. The molecules cleaved by DPP9 may have Ala, or Trp, Ser, Gly, Val or Leu in the P1 position, in place of Pro [11,12].

25 The inventors have characterised the sequence of a nucleic acid molecule which encodes the amino acid sequence shown in SEQ ID NO:2. Thus in a tenth aspect, the invention provides a nucleic acid molecule which encodes the amino acid sequence shown in SEQ ID NO:2.

30 In an eleventh aspect, the invention provides a nucleic acid molecule which consists of the sequence shown in SEQ ID NO:1.

35

In another aspect, the invention provides a nucleic acid molecule which encodes a peptide comprising the amino acid sequence shown in SEQ ID NO:7.

5 The inventors have characterised the nucleotide sequence of the nucleic acid molecule encoding SEQ ID NO:7. The nucleotide sequence of the nucleic acid molecule encoding DPP4-like-2 is shown in SEQ ID NO:8. Thus, in one embodiment, the nucleic acid molecule comprises the  
10 nucleotide sequence shown in SEQ ID NO:8. In another embodiment, the nucleic acid molecule consists of the nucleotide sequence shown in SEQ ID NO:8.

The inventors recognise that a nucleic acid molecule which  
15 has the nucleotide sequence shown in SEQ ID NO:8 could be made by producing only the fragment of the nucleotide sequence which is translated. Thus in an embodiment, the nucleic acid molecule does not contain 5' or 3' untranslated nucleotide sequences.

20 As described herein, the inventors observed RNA of 4.4 kb and a minor band of 4.8 kb in length which hybridised to a nucleic acid molecule comprising sequence shown in SEQ ID NO:8. It is possible that these mRNA species are splice  
25 variants. Thus in another embodiment, the nucleic acid molecule comprises the nucleotide sequence shown in SEQ ID NO:8 and which is approximately 4.4 kb or 4.8 kb in length.

In another embodiment, the nucleic acid molecule is  
30 selected from the group of nucleic acid molecules consisting of DPP4-like-2a, DPP4-like-2b and DPP4-like-2c, as shown in Figure 2.

In another aspect, the invention provides a nucleic acid  
35 molecule having a sequence shown in SEQ ID NO: 3.

In a twelfth aspect, the invention provides a nucleic acid molecule which is capable of hybridising to a nucleic acid molecule consisting of the sequence shown in SEQ ID NO:1 in  
5 stringent conditions, and which encodes a peptide which has the substrate specificity of the sequence shown in SEQ ID NO:2. As shown in the Northern blot analysis described herein, DPP9 mRNA hybridises specifically to the sequence shown in SEQ ID NO:1, after washing in 2XSSC/ 1.0%SDS at  
10 37°C, or after washing in 0.1XSSC/0.1% SDS at 50°C. "Stringent conditions" are conditions in which the nucleic acid molecule is exposed to 2XSSC/ 1.0% SDS. Preferably, the nucleic acid molecule is capable of hybridising to a molecule consisting of the sequence shown in SEQ ID NO:1 in  
15 high stringent conditions. "High stringent conditions" are conditions in which the nucleic acid molecule is exposed to 0.1XSSC/ 0.1%SDS at 50°C.

As described herein, the inventors believe that the gene  
20 which encodes DPP9 is located at band p13.3 on human chromosome 19. The location of the DPP9 gene is distinguished from genes encoding other prolyl oligopeptidases, which are located on chromosome 2, at bands 2q24.3 and 2q23, chromosome 7 or chromosome 15q22.  
25 Thus in an embodiment, the nucleic acid molecule is one capable of hybridising to a gene which is located at band p13.3 on human chromosome 19.

It is recognised that a nucleic acid molecule which encodes  
30 the amino acid sequence shown in SEQ ID NO:2, or which comprises the sequence shown in SEQ ID NO:1, could be made by producing the fragment of the sequence which is translated, using standard techniques [30,31]. Thus in an embodiment, the nucleic acid molecule does not contain 5'  
35 or 3' untranslated sequences.

In a thirteenth aspect, the invention provides a vector which comprises a nucleic acid molecule of the tenth aspect of the invention. In one embodiment, the vector is capable of replication in a COS-7 cell, CHO cell or 293T cell, or  
5 E.coli. In another embodiment, the vector is selected from the group consisting of  $\lambda$ TripleEx, pTripleEx, pGEM-T Easy Vector, pSecTag2Hygro, pet15b, pEE14.HCMV.gs and pCDNA3.1/V5/His.

10 In a fourteenth aspect, the invention provides a cell which comprises a vector of the thirteenth aspect of the invention. In one embodiment, the cell is an E.coli cell. Preferably, the E. coli is MC1061, DH5 $\alpha$ , JM109, BL21DE3, pLysS. In another embodiment, the cell is a COS-7, COS-1,  
15 293T or CHO cell.

In a fifteenth aspect, the invention provides a method for making a peptide of the first aspect of the invention comprising, maintaining a cell according to the fourteenth  
20 aspect of the invention in conditions sufficient for expression of the peptide by the cell. The conditions sufficient for expression are described herein. In one embodiment, the method comprises the further step of isolating the peptide.

25

In a sixteenth aspect, the invention provides a peptide when produced by the method of the fifteenth aspect.

In a seventeenth aspect, the invention provides a  
30 composition comprising a peptide of the first aspect and a pharmaceutically acceptable carrier.

In an eighteenth aspect, the invention provides an antibody which is capable of binding a peptide according to the  
35 first aspect of the invention. The antibody can be

prepared by immunising a subject with purified DPP9 or a fragment thereof according to standard techniques [35]. An antibody may be prepared by immunising with transiently transfected DPP9<sup>+</sup> cells. It is recognised that the  
5 antibody is useful for inhibiting activity of DPP9. In one embodiment, the antibody of the eighteenth aspect of the invention is produced by a hybridoma cell.

In a nineteenth aspect, the invention provides a hybridoma  
10 cell which secretes an antibody of the nineteenth aspect.

## DETAILED DESCRIPTION OF THE INVENTION

## EXAMPLES

General

Restriction enzymes and other enzymes used in cloning were  
5 obtained from Boehringer Mannheim Roche. Standard molecular  
biology techniques were used unless indicated otherwise.

DPP9 Cloning

The nucleotide sequence of DPP8 shown in Figure 1 was used  
10 to search the GenBank database for homologous nucleotide  
sequences. Nucleotide sequences referenced by GenBank  
accession numbers AC005594 and AC005783 were detected and  
named GDD. The GDD nucleotide sequence is 39.5 kb and has  
19 predicted exons. The analysis of the predicted exon-  
15 intron boundaries in GDD suggests that the predicted open  
reading frame of GDD is 3.6 kb in length.

In view of the homology of DPP8 and the GDD nucleotide  
sequences, we hypothesised the existence of DPPIV-like  
20 molecules other than DPP8. We used oligonucleotide primers  
derived from the nucleotide sequence of GDD and reverse  
transcription PCR (RT-PCR) to isolate a cDNA encoding  
DPPIV-like molecules.

25 RT-PCR amplification of human liver RNA derived from a pool  
of 4 patients with autoimmune hepatitis using the primers  
GDD pr 1F and GDD pr 1R (Table 1) produced a 500 base pair  
product. This suggested that DPPIV-like molecules are  
likely to be expressed in liver cells derived from  
30 individuals with autoimmune hepatitis and that RNA derived  
from these cells is likely to be a suitable source for  
isolating cDNA clones encoding DPPIV-like molecules.

Primers GDD pr 3F and GDD pr 1R (Table 1) were then used to  
35 isolate a cDNA clone encoding a DPP4-like molecule. A 1.6  
kb fragment was observed named DPP4-like-2a. Primers GDD

pr 15F and GDD pr 7R (Table 1) were then used to isolate a cDNA clone encoding a DPP4-like molecule. A 1.9 kb product was observed and named DPP4-like-2b. As described further herein, the sequence of DPP4-like-2b overlaps with the  
5 sequence of DPP4-like-2a.

The DPP4-like-2a and 2b fragments were gel purified using WIZARD® PCR preps kit and cloned into the pGEM®-T-easy plasmid vector using the *EcoRI* restriction sites. The  
10 ligation reaction was used to transform JM109 competent cells. The plasmid DNA was prepared by miniprep. The inserts were released by *EcoRI* restriction digestion. The DNA was sequenced in both directions using the M13Forward and M13Reverse sequencing primers. The complete sequence  
15 of DPP4-like-2a and 2b fragments was derived by primer walking.

The nucleotide sequence 5' adjacent to DPP4-like-2b was obtained by 5'RACE using dC tailing and the gene specific  
20 primers GDD GSP1.1 and 2.1 (Table 1). A fragment of 500 base pairs (DPP4-like-2c) was observed. The fragment was gel purified using WIZARD® PCR preps kit and cloned into the pGEM®-T-easy plasmid vector using the *EcoRI* restriction sites. The ligation reaction was used to transform JM109  
25 competent cells. The plasmid DNA was prepared by miniprep. The inserts were released by *EcoRI* restriction digestion. The DNA was sequenced in both directions using the M13Forward and M13Reverse sequencing primers.

30 We identified further sequences, BE727051 and BE244612, with identity to the 5' end of DPP9. These were discovered while performing BLASTn with the 5' end of the DPP9 nucleotide sequence. BE727051 contained further 5' sequence for DPP9, which was also present in the genomic sequence  
35 for DPP9 on chromosome 19p13.3. This was used to design primer DPP9-22F (5'GCCGGCGGGTCCCCTGTGTCCG3'). Primer 22F

was used in conjunction with primer GDD3'end  
(5'GGGCGGGACAAAGTGC CTCACTGG3') on cDNA made from the human  
CEM cell line to produce a 3000bp product as expected  
Figure 11.

5

Nucleotide sequence analysis of DPP4-like-2a, 2b, and 2c  
fragments.

An analysis of the nucleotide sequence of fragments DPP4-  
like 2a, 2b and 2c with the Sequencher™ version 3.0  
10 computer program (Figure 3), and the 5' fragment isolated  
by primers DPP9-22F and GDD3'end, revealed the nucleotide  
sequence shown in Figure 4.

The predicted amino acid sequence shown in Figure 4 was  
15 compared to a predicted amino acid sequence encoded by a  
predicted open reading frame of GDD (predicted from the  
nucleotide sequence referenced by GenBank Accession Nos.  
AC005594 and AC005783), to determine the relatedness of the  
nucleotide sequence of Figure 4 to the nucleotide sequence  
20 of the predicted open reading frame of GDD (Figure 5).  
Regions of amino acid identity were observed suggesting  
that there may be regions of nucleotide sequence identity  
of the predicted open reading frame of GDD and the sequence  
of Figure 4. However, as noted in Figure 5, there are  
25 regions of amino acid sequence encoded by the sequence of  
Figure 4 and the amino acid sequence encoded by the  
predicted open reading frame of GDD which are not  
identical, demonstrating that the nucleotide sequences  
encoding the predicted open reading frame of GDD and the  
30 sequence shown in Figure 4 are different nucleotide  
sequences.

As described further herein, the predicted amino acid  
sequence encoded by the cDNA sequence shown in Figure 4 is  
35 homologous to the amino acid sequence of DPP8 (Figure 6).  
Accordingly, and as a cDNA consisting of the nucleotide

sequence shown in Figure 4 was not known, the sequence shown in Figure 4 was named cDNA DPP9.

The predicted amino acid sequence encoded by cDNA DPP9 (called DPP9) is 969 amino acids and is shown in Figure 4. The alignment of DPP9 and DPP8 amino acid sequences suggests that the nucleotide sequence shown in Figure 4 may be a partial length clone. Notwithstanding this point, as discussed below, the inventors have found that the alignment of DPP9 amino acid sequence with the amino acid sequences of DPP8, DPP4 and FAP shows that DPP9 comprises sequence necessary for providing enzymolysis and utility. In view of the similarity between DPP9 and DPP8, a full length clone may be of the order of 882 amino acids. A full length clone could be obtained by standard techniques, including for example, the RACE technique using an oligonucleotide primer derived from the 5' end of cDNA DPP9.

In view of the homology between the DPP8 and DPP9 amino acid sequences, it is likely that cDNA DPP9 encodes an amino acid sequence which has dipeptidyl peptidase enzymatic activity. Specifically, it is noted that the DPP9 amino acid sequence contains the catalytic triad Ser-Asp-His in the order of a non-classical serine protease as required for the charge relay system. The serine recognition site characteristic of DPP4 and DPP4-like family members, GYSWGG, surrounds the serine residue also suggesting that DPP9 cDNA will encode a DPP4-like enzyme activity.

Further, DPP9 amino acid sequence also contains the two glutamic acid residues located at positions 205 and 206 in DPPIV. These are believed to be essential for the dipeptidyl peptidase enzymatic activity. By sequence alignment with DPPIV, the residues in DPP8 predicted to

play a pivotal role in the pore opening mechanism in Blade 2 of the propeller are E<sup>259</sup>, E<sup>260</sup>. These are equivalent to the residues Glu<sup>205</sup> and Glu<sup>206</sup> in DPPIV which previously have been shown to be essential for DPPIV enzyme activity. A point mutation Glu259Lys was made in DPP8 cDNA using the Quick Change Site directed Mutagenesis Kit (Stratagene, La Jolla). COS-7 cells transfected with wildtype DPP8 cDNA stained positive for H-Ala-Pro4MbNA enzyme activity while the mutant cDNA gave no staining. Expression of DPP8 protein was demonstrated in COS cells transfected with wildtype and mutant cDNAs by immunostaining with anti-V5 mAB. This mAB detects the V5 epitope that has been tagged to the C-terminus of DPP8 protein. Point mutations were made to each of the catalytic residues of DPP8, Ser739A, Asp817Ala and His849Ala, and each of these residues were also determined to be essential for DPP8 enzyme activity. In summary, the residues that have been shown experimentally to be required for enzyme activity in DPPIV and DPP8 are present in the DPP9 amino acid sequence: Glu<sup>354</sup>, Glu<sup>355</sup>, Ser<sup>836</sup>, Asp<sup>914</sup> and His<sup>946</sup>.

The DPP9 amino acid sequence shows the closest relatedness to DPP8, having 77% amino acid similarity and 60% amino acid identity. The relatedness to DPPIV is 25% amino acid identity and 47% amino acid similarity. The % similarity was determined by use of the program/algorithm "GAP" which is available from Genetics Computer Group (GCG), Wisconsin.

#### DPP9 mRNA Expression Studies

DPP4-like-2a was used to probe a Human Master RNA Blot™ (CLONTECH Laboratories Inc., USA) to study DPP9 tissue expression and the relative levels of DPP9 mRNA expression.

The DPP4-like-2a fragment hybridised to all tissue mRNA samples on the blot. The hybridisation also indicated high

levels of DPP9 expression in most of the tissues samples on the blot (data not shown).

The DPP4-like-2a fragment was then used to probe two  
5 Multiple Tissue Northern Blots™ (CLONTECH Laboratories Inc., USA) to examine the mRNA expression and to determine the size of DPP9 mRNA transcript.

The autoradiographs of the DPP9 Multiple Tissue Northern  
10 blot are shown in Figure 8. The DPP9 transcript was seen in all tissues examined confirming the results obtained from the Master RNA blot. A single major transcript 4.4 kb in size was seen in all tissues represented on two Blots after 16 hours of exposure. Weak bands could also be seen in some  
15 tissues after 6 hours of exposure. The DPP9 transcript was smaller than the 5.1 kb mRNA transcript of DPP8. A minor, very weak transcript 4.8 kb in size was also seen in the spleen, pancreas, peripheral blood leukocytes and heart. The highest mRNA expression was observed in the spleen and  
20 heart. Of all tissues examined the thymus had the least DPP9 mRNA expression. The Multiple Tissue Northern Blots were also probed with a  $\beta$ -actin positive control. A 2.0 kb band was seen in all tissues. In addition as expected a 1.8 kb  $\beta$ -actin band was seen in heart and skeletal muscle.

25

#### Rat DPP9 expression

A Rat Multiple Tissue Northern Blot (CLONTECH Laboratories, Inc., USA; catalogue #: 7764-1) was hybridised with a human DPP9 radioactively labeled probe, made using Megaprime DNA  
30 Labeling kit and [32P] dCTP (Amersham International plc, Amersham, UK). The DPP9 PCR product used to make the probe was generated using Met3F (GGCTGAGAG GAT GGCCACCAC CGGG) as the forward primer and GDD 3'end (GGGCGGGACAAAGTGC CTCACTGG) as the reverse primer. The hybridisation was

carried out according to the manufacturers' instructions at 60° C to detect cross-species hybridisation. After overnight hybridization the blot was washed at room temperature (2x SSC, 0.1% SDS) then at 40° C (0.1xSSC, 0.1%SDS).

The human cDNA probe identified two bands in all tissues examined except in testes. A major transcript of 4 kb in size was seen in all tissues except testes. This 4 kb transcript was strongly expressed in the liver, heart and brain. A second weaker transcript 5.5 kb in size was present in all tissues except skeletal muscle and testes. However in the brain the 5.5kb transcript was expressed at a higher level than the 4.4 kb transcript. In the testes only one transcript approximately 3.5 kb in size was detected. Thus, rat DPP9 mRNA hybridised with a human DPP9 probe indicating significant homology between DPP9 of the two species. The larger 5.5 kbtranscript observed may be due to crosshybridisation to rat DPP8.

#### Mouse DPP9 expression

A Unigene cluster for Mouse DPP9 was identified (UniGene Cluster Mm.33185) by homology to human DPP9. An analysis of expressed sequence tags contained in this cluster and mouse genomic sequence (AC026385) for Chromosome 17 with the Sequencher™ version 3.0 computer program revealed the nucleotide sequence shown in Figure 9. This 3517bp cDNA encodes a 869 aa mouse DPP9 protein (missing N-terminus) with 91% amino acid identity and 94 % amino acid similarity to human DPP9. The mouse DPP9 amino acid sequence also has the residues required for enzyme activity, Ser, Asp and His and the two Glu residues.

The primers mgdd-pr1F (5'ACCTGGGAGGAAGCACCCCACTGTG3') and mgdd-pr4R (5'TTCCACCTGGTCCTCAATCTCC3') were designed from

this sequence and used to amplify a 452 bp product as expected from liver mouse cDNA, as described below.

#### RNA preparation

- 5 B57Bl6 mice underwent carbon tetrachloride treatment to induce liver fibrosis. Liver RNA were prepared from snap-frozen tissues using the TRIZOL<sup>®</sup> Reagent and other standard methods.

#### cDNA synthesis

- 10 2µg of liver RNA was reverse-transcribed using SuperScript II RNase H- Reverse Transcriptase (Gibco BRL).

#### PCR

- PCR using mDPP9- 1F ( ACCTGGGAGGAAGCACCCCACTGTG) as the forward primer and mDPP9-2R ( CTCTCCACATGCAGGGCTACAGAC) as  
15 the reverse primer was used to synthesise a 550 base pair mouse DPP9 fragment. The PCR products were generated using AmpliTaq Gold<sup>®</sup> DNA Polymerase. The PCR was performed as follows: denaturation at 95° C for 10 min, followed by 35 cycles of denaturation at 95 ° C for 30 seconds, primer  
20 annealing at 60 ° C for 30 seconds, and an extension 72° C for 1 min.

#### Southern Blot

- DPP9 PCR products from six mice as well as the largest human DPP9 PCR product were run on a 1% agarose gel. The  
25 DNA on the gel was then denatured using 0.4 M NaOH and transferred onto a Hybond-N+ membrane (Amersham International plc, Amersham, UK). The largest human DPP9 PCR product was radiolabeled using the Megaprime DNA Labeling kit and [32<sup>P</sup>] dCTP (Amersham International plc,  
30 Amersham, UK). Unincorporated label was removed using a NAP column (Pharmacia Biotech, Sweden) and the denatured probe was incubated with the membrane for 2 hours at 60° C in Express Hybridisation solution (CLONTECH Laboratories, Inc., USA). (Figure 12). Thus, DPP9 mRNA of appropriate  
35 size was detected in fibrotic mouse liver using rt-PCR. Furthermore, the single band of mouse DPP9 cDNA hybridised

with a human DPP9 probe indicating significant homology between DPP9 of the two species.

## CLAIMS

1. A peptide which comprises:
- 5 (a) the sequence shown in SEQ ID NO:2; or
- (b) the amino acid sequences:
- His<sup>833</sup>GlyTrpSerTyrGlyGlyPheLeu; Leu<sup>913</sup>AspGluAsnValHisPhePhe;  
Glu<sup>944</sup>ArgHisSerIleArg and Phe<sup>350</sup>ValIleGlnGluGluPhe, and which  
has the substrate specificity of the sequence shown in SEQ  
10 ID NO:2; or
- (c) the sequence which has at least 60% identity with  
the sequence shown in SEQ ID NO:2, and which has the  
substrate specificity of the sequence shown in SEQ ID NO:2;  
or
- 15 (d) the sequence shown in SEQ ID NO:4.
2. A peptide according to claim 1 (c), wherein the  
amino acid identity is at least 75%.
- 20 3. A peptide according to claim 1 (c) wherein the  
amino acid identity is at least 95%.
4. A fragment of the sequence shown in SEQ ID NO:2  
which has the substrate specificity of the sequence shown  
25 in SEQ ID NO:2.
5. A fragment according to claim 4 which comprises  
part of the sequence shown in SEQ ID NO:2.
- 30 6. A fusion protein comprising the amino acid  
sequence shown in SEQ ID NO:2 linked with a further amino  
acid sequence, the fusion protein having the substrate  
specificity of the sequence shown in SEQ ID NO:2.
- 35 7. A fusion protein according to claim 6 wherein the  
further amino acid sequence is selected from the group

consisting of GST, V5 epitope and His tag.

8. A method of identifying a molecule capable of inhibiting cleavage of a substrate by DPP9 comprising the following steps:

- (a) contacting DPP9 with the molecule;
- (b) contacting DPP9 of step (a) with a substrate capable of being cleaved by DPP9, in conditions sufficient for cleavage of the substrate by DPP9; and
- (c) detecting substrate not cleaved by DPP9, to identify that the molecule is capable of inhibiting cleavage of the substrate by DPP9.

9. A method of identifying a molecule capable of inhibiting specifically, the cleavage of a substrate by DPP9, the method comprising the following steps:

- (a) contacting DPP9 and a further protease with the molecule;
- (b) contacting DPP9 and the further protease of step (a) with a substrate capable of being cleaved by DPP9 and the further protease, in conditions sufficient for cleavage of the substrate by DPP9 and the further protease; and
- (c) detecting substrate not cleaved by DPP9, but cleaved by the further protease, to identify that the molecule is capable of inhibiting specifically, the cleavage of the substrate by DPP9.

10. A method of reducing or inhibiting the catalytic activity of DPP9, the method comprising the step of contacting DPP9 with an inhibitor of DPP9 catalytic activity.

11. A method of cleaving a substrate comprising the step of contacting the substrate with DPP9 in conditions sufficient for cleavage of the substrate by DPP9.

12. A nucleic acid molecule which:

- (a) encodes the sequence shown in SEQ ID NO:2; or
- (b) consists of the sequence shown in SEQ ID NO:1; or
- (c) is capable of hybridizing to a nucleic acid

5 molecule consisting of the sequence shown in SEQ ID NO:1 in stringent conditions, and which encodes a peptide which has the substrate specificity of the sequence shown in SEQ ID NO:2; or

- (d) consists of the sequence shown in SEQ ID NO:3.

10

13. A nucleic acid molecule according to claim 12 (c) wherein the molecule is capable of hybridising in high stringent conditions.

15

14. A nucleic acid molecule according to claim 12 which is capable of hybridising to a gene which is located at band p13.3 on human chromosome 19.

20

15. A nucleic acid molecule according to claim 12 which does not contain 5' or 3' untranslated regions.

25

16. A fragment of a nucleic acid molecule consisting of the sequence shown in SEQ ID NO:1, which encodes a peptide which has the substrate specificity of the sequence shown in SEQ ID NO:2.

17. A fragment according to claim 16 which consists of part of the sequence shown in SEQ ID NO:1.

30

18. A vector comprising a nucleic acid molecule according to claim 12.

19. A cell comprising a vector according to claim 18.

35

20. A composition comprising a peptide according to claim 1.

21. An antibody which is capable of binding to a peptide according to claim 1.

5           22. An antibody according to claim 21 which is produced by a hybridoma cell.

23. A hybridoma cell capable of making an antibody according to claim 22.

10 .

24. A peptide comprising the sequence shown in SEQ ID NO: 7.

15           25. A nucleic acid molecule comprising the sequence shown in SEQ ID NO:8.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/AU01/01388

<b>A. CLASSIFICATION OF SUBJECT MATTER</b>														
Int. Cl. <sup>7</sup> : C12N 9/64, 5/10, 5/12; A61K 38/43; C07K 16/40														
According to International Patent Classification (IPC) or to both national classification and IPC														
<b>B. FIELDS SEARCHED</b>														
Minimum documentation searched (classification system followed by classification symbols)														
Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched														
Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)														
ANGIS sequence search: sequence ID No 2, 4 and 7; STN: File CA sequences in claim 1 part (b)														
<b>C. DOCUMENTS CONSIDERED TO BE RELEVANT</b>														
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.												
P,X	Eur. J. Biochem, Volume 267, No.20, issued Oct 2000, C.A.Abbott et al, "Cloning, expression and chromosomal localization of a novel human dipeptidyl peptidase (DPP) IV homolog, DPP8", pages 6140-6150. See whole document but in particular abstract and sequence listings.	1-23												
P,X	WO 01/19866 A1 (THE UNIVERSITY OF SYDNEY) 22 March 2001 Whole document.	1-23												
P,X	GenPept accession Number AAH00970 mRNA, partial cds. Submitted 16 Nov 2000.	24, 25												
<input type="checkbox"/> Further documents are listed in the continuation of Box C <input checked="" type="checkbox"/> See patent family annex														
<table border="0"> <tr> <td>* Special categories of cited documents:</td> <td>"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention</td> </tr> <tr> <td>"A" document defining the general state of the art which is not considered to be of particular relevance</td> <td>"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone</td> </tr> <tr> <td>"B" earlier application or patent but published on or after the international filing date</td> <td>"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art</td> </tr> <tr> <td>"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)</td> <td>"&amp;" document member of the same patent family</td> </tr> <tr> <td>"O" document referring to an oral disclosure, use, exhibition or other means</td> <td></td> </tr> <tr> <td>"P" document published prior to the international filing date but later than the priority date claimed</td> <td></td> </tr> </table>			* Special categories of cited documents:	"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention	"A" document defining the general state of the art which is not considered to be of particular relevance	"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone	"B" earlier application or patent but published on or after the international filing date	"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art	"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"&" document member of the same patent family	"O" document referring to an oral disclosure, use, exhibition or other means		"P" document published prior to the international filing date but later than the priority date claimed	
* Special categories of cited documents:	"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention													
"A" document defining the general state of the art which is not considered to be of particular relevance	"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone													
"B" earlier application or patent but published on or after the international filing date	"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art													
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"&" document member of the same patent family													
"O" document referring to an oral disclosure, use, exhibition or other means														
"P" document published prior to the international filing date but later than the priority date claimed														
Date of the actual completion of the international search 6 December 2001		Date of mailing of the international search report 13 DEC 2001												
Name and mailing address of the ISA/AU AUSTRALIAN PATENT OFFICE PO BOX 200, WODEN ACT 2606, AUSTRALIA E-mail address: pct@ipaustralia.gov.au Facsimile No. (02) 6285 3929		Authorized officer  K. LEVER Telephone No : (02) 6283 2254												

INTERNATIONAL SEARCH REPORT  
Information on patent family members

International application No.  
**PCT/AU01/01388**

This Annex lists the known "A" publication level patent family members relating to the patent documents cited in the above-mentioned international search report. The Australian Patent Office is in no way liable for these particulars which are merely given for the purpose of information.

Patent Document Cited in Search Report		Patent Family Member

Operations and is not part of the Official Record**

**BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

- ☐ BLACK BORDERS
- ☐ IMAGE CUT OFF AT TOP, BOTTOM OR SIDES
- ☐ FADED TEXT OR DRAWING
- ☐ BLURRED OR ILLEGIBLE TEXT OR DRAWING
- ☐ SKEWED/SLANTED IMAGES
- ☒ COLOR OR BLACK AND WHITE PHOTOGRAPHS
- ☐ GRAY SCALE DOCUMENTS
- ☐ LINES OR MARKS ON ORIGINAL DOCUMENT
- ☐ REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY
- ☐ OTHER: \_\_\_\_\_

**IMAGES ARE BEST AVAILABLE COPY.**

**As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.**
